

HSG1010 - CO Sensor

CO-Sensor for monitoring of car-parks for ventilation control and alarming

HSG1010

- 0...300ppm
 4...20mA output according to the range
 Range adjustable at time of installation using test cap and applying test gas

Applications

Car-parks and other areas where CO emissions require forced ventilation or CO level monitoring/alarming.

Design

The HSG1010 applies an electro-chemical principal to sense CO ppm concentration in air.

The assembly comprises:

- Electro-chemical sensing element
 Loop-powered (20...28Vdc) PCB with 4...20mA output
 Sinter filte
 IP65 housing in ABS plastic

Sensor distribution should be according to local regulations. Typical regulations require that no sensor shall be further than 25m from any point in the space being monitored which corresponds to one sensor per 1,225m² when the sensor is positioned in the centre of the area.

If no regulations are defined locally then we recommend one sensor per $500 m^2$ to ensure adequate coverage.

Operation & Testing

The HSG1010 is supplied calibrated to a range of 0...300ppm CO. Using the test cap, HSG1001, to apply test gas, it may be calibrated to a user defined range at time of installation. The test cap is also used for periodic checking and recalibration. The test gas applied should be at a flow rate of 0.5 l/min.

If for any reason the PCB is removed from the sensing element for a prolonged length of time then a shorting wire should be place between the sensor pins. If this short-circuit is not applied then the sensor may polarize, in which case, when first plugging the PCB back on to the sensor, the complete assembled unit should be left un-powered for two to three hours to allow it to re-stabilize.

Operation & Testing (cont...)

The HSG1010 is delivered with the PCB fitted. The PCB provides the necessary stabilization and so the HSG1010 may be operated immediately in this case.

Brief disconnection of the PCB from the sensor unit will not de-stabilize the sensor. The screw terminals may be removed from the PCB for connection of the 4...20mA loop wiring without having to remove the PCB from the sensor unit.

To test the unit, connect a 20...28Vdc, 4...20mA loop to the screw terminals. With test gas applied, measure the 4...20mA output signal equivalent to the range 0...300pm CO. Alternatively, at the test pins adjacent to the wiring connection terminals, measure 0.4...2Vdc equivalent to 10...300pm CO.

Accessories & Spares

Test Cap
CO sensor unit
Sinter filter
PCB assembly
Cover for mechanical protection _____ HSG1001 HSG1002 HSG1003 HSG1004 HSG1005

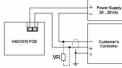

Mounting instructions

- Recommended mounting height is between 0.9m and 1.5m above floor level, or according to local regulations
- regulations
 The housing should be wall mounted in an area that has adequate air movement to ensure good air sampling
 The housing should be positioned with the sensor aperture downward to ensure water cannot be allowed to enter
- The tribusing should be positioned with the sensor aperture dominated to ensure water cannot be above to enter Cable entry point is freely selectable; rear, side or top Cable entry should be sealed via conduit adapter or cable gland to ensure no water is able to enter the housing

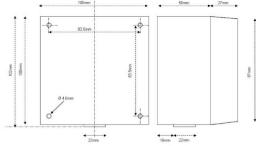

Connections

- Two-wire combined 20...28Vdc power supply and 4...20mA signal output.
 The power supply is not polarity sensitive.

VR - for achieving a DC voltage signal, as alternative to the standard 4...20mA signal, connect a fixed resistance across the 'customer' input:
